Course Title:
BIG DATA
Instructor Name:
Dr. Nasiha
Department:
Computer Science
University:
University of Agriculture Faisalabad

Submission Date:
17 March 2026

Task 1 – Environment Setup

Objective

The purpose of this task is to set up a Python environment for data analysis and understand the basic tools required for future tasks.

Procedure

Anaconda was installed to provide a complete Python environment. After installation, Python was verified to ensure it was working correctly. Jupyter Notebook was then launched, and a new notebook was created to perform basic Python operations such as printing output and simple calculations.
Google Colab was also used as an online alternative, where a notebook was created and tested successfully. Essential libraries including pandas, NumPy, matplotlib, and seaborn were installed and imported for data analysis purposes.
Additionally, a GitHub account was set up, and a repository was created to upload and manage the notebook files.

Outcome

The environment was successfully configured, and all tools were tested. Both Jupyter Notebook and Google Colab worked properly, and required libraries were installed. The GitHub repository was also created for project management.

Deliverables

- Screenshot of environment setup
- Jupyter Notebook file
- GitHub repository link
